Co-care of Heart Failure and Chronic Kidney Disease

Wei-Hung Lin

Division of Nephrology, Department of Internal Medicine, National Cheng Kung University Hospital

Heart failure and chronic kidney disease (CKD) are often interlinked, forming a challenging cardio-renal syndrome that demands multidisciplinary care. Effective co-management integrates cardiology and nephrology expertise to optimize patient outcomes. This talk will explore the pathophysiological interplay between heart failure and CKD, highlighting shared risk factors and mechanisms. It will focus on practical strategies, including tailored pharmacological approaches, novel therapies, and collaborative care models, to address the complexities of managing these patients. Through case studies and evidence-based insights, the discussion aims to enhance understanding and foster improved outcomes in the co-care of heart failure and CKD.
